Branson Nearshore

The Branson Nearshore Acquisition provides a regional benefit as it preserves a “feeder bluff” which provides sediment to the longest drift cell in King County—stretching from Three Tree Point to Alki Point.

Branson Nearshore

The Branson Nearshore contains 247 feet of natural unmodified shoreline, two acres of intertidal zone and six acres of nearshore and upland riparian lands. This nearshore environment is an important sediment source for the longest drift cell in King County and provides cool fresh spring water. It aids survival of juvenile salmon with its large woody debris on the beach, overhanging vegetation (an important source of terrestrial insects) and eelgrass beds. It benefits subadult and adult salmon by hosting a surf smelt spawning bed which produces an important food source.
